This G  $\alpha$ -GTP in turn stimulates activity of adenylyl cyclase (AC), which catalyzes the transformation of ATP into cAMP. AC is primarily bound to the cell membrane, and it is this form that is responsible for transmitting the epinephrine

Cells exclude some substances, take in others, and

excrete still others, all in controlled quantities. 3.4 The Cell Membrane - Concepts of Biology | OpenStax In 1972, S.J. Singer and Garth L.

Nicolson proposed a new model that provides microscopic observations and better explains plasma membrane function. The explanation, the fluid mosaic model, has evolved somewhat over time, but it still best accounts for plasma membrane structure and function as we now understand them. 5.1
